

Step-1

Let \mathbf{V} and \mathbf{W} be subspaces of some vector space. Let us assume that the zero vector is the only common vector to these spaces.

In such case $\mathbf{V} + \mathbf{W}$ is called the direct sum of \mathbf{V} and \mathbf{W} and is denoted by $\mathbf{V} \oplus \mathbf{W}$.

Step-2

Let \mathbf{V} be spanned by $(1,1,1)$ and $(1,0,1)$. We need to find \mathbf{W} such that $\mathbf{V} \cap \mathbf{W} = \{0\}$.

Since \mathbf{V} is spanned by two vectors, \mathbf{V} is a plane in \mathbf{R}^3 . Therefore, \mathbf{W} should be a line, perpendicular to \mathbf{V} .

If (a,b,c) is a vector along \mathbf{W} , then we get the following:

$$\begin{aligned}(a,b,c)(1,1,1) &= 0 \\ a+b+c &= 0 \\ (a,b,c)(1,0,1) &= 0 \\ a+c &= 0\end{aligned}$$

Step-3

Thus, we get $a = -c$ and therefore, $b = 0$. Thus, the vector $(1,0,-1)$ is perpendicular to the plane, spanned by $(1,1,1)$ and $(1,0,1)$.

Thus, \mathbf{W} is a line, which contains the vector $(1,0,-1)$.

It is clear that $\mathbf{V} \cap \mathbf{W} = \{0\}$.

Therefore, $\mathbf{R}^3 = \mathbf{V} \oplus \mathbf{W}$.

Step-4

Let if possible, $x = v_1 + w_1$ and $x = v_2 + w_2$, where $v_1, v_2 \in \mathbf{V}$ and $w_1, w_2 \in \mathbf{W}$. Then we get

$$\begin{aligned}0 &= x - x \\ &= (v_1 + w_1) - (v_2 + w_2) \\ &= v_1 - v_2 + w_1 - w_2\end{aligned}$$

This is possible, only if $v_1 - v_2 = 0$ and $w_1 - w_2 = 0$. This shows that $v_1 = v_2$ and $w_1 = w_2$. Therefore, when $x = v + w$, where $v \in \mathbf{V}$ and $w \in \mathbf{W}$, then this the unique way to express x as a sum of a vector from \mathbf{V} and a vector from \mathbf{W} .
