

Step-1

The lengths $L = 5, 6$ and 7 feet corresponding to the applied forces $F = 1, 2$ and 4 respectively.

Hooke's Law states that, $L = a + bF$.

Substitute the $F = 1, 2$ and 4 , $L = 5, 6$ and 7 , to get the system of equations:

$$a + b(1) = 5$$

$$a + b(2) = 6$$

$$a + b(3) = 7$$

Write the system of equations in the matrix form.

$$\begin{bmatrix} 1 & 1 \\ 1 & 2 \\ 1 & 4 \end{bmatrix} \begin{bmatrix} a \\ b \end{bmatrix} = \begin{bmatrix} 5 \\ 6 \\ 7 \end{bmatrix}, \text{ where } A = \begin{bmatrix} 1 & 1 \\ 1 & 2 \\ 1 & 4 \end{bmatrix}, \hat{x} = \begin{bmatrix} a \\ b \end{bmatrix} \text{ and } B = \begin{bmatrix} 5 \\ 6 \\ 7 \end{bmatrix}$$

Step-2

The least-squares solution is given by,

$$A^T A \hat{x} = A^T B, \text{ that is } \hat{x} = (A^T A)^{-1} A^T B.$$

Find the transpose of the matrix A .

$$\begin{aligned} A^T &= \begin{bmatrix} 1 & 1 \\ 1 & 2 \\ 1 & 4 \end{bmatrix} \\ &= \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 4 \end{bmatrix} \end{aligned}$$

Find the product of the matrices A and A^T .

$$\begin{aligned} A^T A &= \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 4 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 1 & 2 \\ 1 & 4 \end{bmatrix} \\ &= \begin{bmatrix} 1+1+1 & 1+2+4 \\ 1+2+4 & 1+4+16 \end{bmatrix} \\ &= \begin{bmatrix} 3 & 7 \\ 7 & 21 \end{bmatrix} \end{aligned}$$

Step-3

Use the following formula: Let $X = \begin{bmatrix} w & x \\ y & z \end{bmatrix}$, then the inverse of the matrix X is defined by, $X^{-1} = \frac{1}{wz - xy} \begin{bmatrix} z & -x \\ -y & w \end{bmatrix}$, where $wz - xy \neq 0$.

Find the inverse of the matrix $A^T A$.

$$\begin{aligned} (A^T A)^{-1} &= \frac{1}{3(21) - 7(7)} \begin{bmatrix} 21 & -7 \\ -7 & 3 \end{bmatrix} \\ &= \frac{1}{14} \begin{bmatrix} 21 & -7 \\ -7 & 3 \end{bmatrix} \end{aligned}$$

Now, find the product of matrices A^T and B .

$$\begin{aligned} A^T B &= \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 4 \end{bmatrix} \begin{bmatrix} 5 \\ 6 \\ 7 \end{bmatrix} \\ &= \begin{bmatrix} 5+6+7 \\ 5+12+28 \end{bmatrix} \\ &= \begin{bmatrix} 18 \\ 45 \end{bmatrix} \end{aligned}$$

Step-4

To determine the $\hat{x} = (A^T A)^{-1} A^T B$, find the product of matrices $(A^T A)^{-1}$ and $A^T B$:

$$\begin{aligned} \hat{x} &= (A^T A)^{-1} A^T B \\ \begin{bmatrix} a \\ b \end{bmatrix} &= \frac{1}{14} \begin{bmatrix} 21 & -7 \\ -7 & 3 \end{bmatrix} \begin{bmatrix} 18 \\ 45 \end{bmatrix} \\ &= \frac{1}{14} \begin{bmatrix} 378 - 315 \\ -126 + 135 \end{bmatrix} \\ &= \frac{1}{14} \begin{bmatrix} 63 \\ 9 \end{bmatrix} \\ &= \begin{bmatrix} \frac{9}{2} \\ \frac{9}{14} \end{bmatrix} \end{aligned}$$

Therefore, the required normal length is $\boxed{a = \frac{9}{2}}$.
