

## Step-1

(a)

All sequences like  $(1, 0, 1, 0, \dots)$  that include infinitely many zeros is not a subspace.

Since,

$$(1, 0, 1, 0, \dots) + (1, 0, 1, 0, \dots) = (2, 0, 2, 0, \dots)$$

That include infinitely many zeros does not belong to the set.

It is not closed under vector addition.

Hence, not a subspace

## Step-2

(b)

Consider the set of all sequences  $(x_1, x_2, \dots)$  with  $x_j = 0$  from some point onward.

Let,

$$x = (x_1, x_2, \dots) \text{ With } x_j = 0 \text{ for some point onward}$$

$$y = (y_1, y_2, \dots) \text{ With } y_j = 0 \text{ for some point onward}$$

Then,

$$x + y = (x_1 + y_1, x_2 + y_2, \dots) \text{ With } x_l$$

Where  $l = \max\{i, j\}, x_l = 0$  for some point  $l$  onward.

Let  $c$  be any scalar.

$$\text{Then, } cx = (cx_1, cx_2, \dots) \text{ with } cx_j = 0 \text{ for some point onward}$$

Hence the given set is a subspace.

## Step-3

(c)

Consider the set of all decreasing sequences:  $x_{j+1} \leq x_j$  for each  $j$ .

This set is not subspace of  $\mathbb{R}^\infty$ .

Since,

Let  $x = (3, 2, 1, 0, -1, \dots)$ , is a decreasing sequence. And let  $c = -2$

Then,

$cx = (-6, -4, -2, 0, 2, \dots)$  Is an increasing sequence

Therefore, it is not closed under scalar multiplication.

Hence, it is not a subspace.

## Step-4

(d)

Given set is the set of all convergent sequences: then  $x_j$  have a limit as  $j \rightarrow \infty$ .

Let  $S = \{x_j / x_j \text{ is a convergent sequence}\}$

Let  $x_j$  and  $y_j$  be the elements of  $S$ .

Then  $x_j$  and  $y_j$  are convergent sequences.

Let,

$$\lim_{j \rightarrow \infty} x_j = L \text{ and}$$

$$\lim_{j \rightarrow \infty} y_j = M$$

Now,

$$\begin{aligned} \lim_{j \rightarrow \infty} (x_j + y_j) &= \lim_{j \rightarrow \infty} x_j + \lim_{j \rightarrow \infty} y_j \\ &= L + M \end{aligned}$$

Then,  $x_j + y_j$  is also convergent

Therefore,  $x_j + y_j \in S$

## Step-5

Let  $c$  be any scalar and let  $x_j \in S$

Then,  $x_j$  is a convergent sequence

Let,

$$\lim_{j \rightarrow \infty} x_j = L$$

Now,

$$\begin{aligned}\lim_{j \rightarrow \infty} (cx_j) &= c \left( \lim_{j \rightarrow \infty} x_j \right) \\ &= cL\end{aligned}$$

Then,  $cx_j$  is convergent

Therefore,  $cx_j \in S$

Hence  $S$  is a subspace.

## Step-6

(e)

Given set is the set of all arithmetic progressions:  $x_{j+1} - x_j$  is the same for all  $j$ .

This is a subspace.

Let,

$$x = x_1, x_2, \dots, x_n, \dots$$

Then,

$$\begin{aligned}x_2 - x_1 &= x_3 - x_2 \\ &\vdots \\ &= d\end{aligned}$$

And,

$$y = y_1, y_2, \dots, y_n, \dots$$

## Step-7

Then,

$$\begin{aligned} y_2 - y_1 &= y_3 - y_2 \\ &\vdots \\ &= t \end{aligned}$$

Now,

$$\begin{aligned} x + y &= x_1 + y_1, x_2 + y_2, \dots \\ x_2 + y_2 - x_1 - y_1 &= d - t \\ x_3 + y_3 - x_2 - y_2 &= d - t \end{aligned}$$

Therefore, vector addition is closed.

## Step-8

And,  $cx$  is  $cx_1, cx_2, cx_3, \dots$

Now,

$$\begin{aligned} cx_2 - cx_1 &= cx_3 - cx_2 \\ &\vdots \\ &= cd \end{aligned}$$

The scalar multiplication is closed.

Therefore, this is a vector space.

## Step-9

(f)

Given set is the set of all geometric progressions  $(x_1, kx_1, k^2x_1, \dots)$  allowing all  $k$  and  $x_1$ .

It is not a subspace.

Since,

Let

$(x_1, kx_1, k^2x_1, \dots), (y_1, ty_1, t^2y_1, t^3y_1, \dots)$  Be the geometric progressions.

Addition these two

$$(x_1 + y_1, kx_1 + ty_1 + k^2x_1 + t^2y_1, \dots)$$

Therefore, addition is not closed.

Hence it is not a vector space.
