

Step-1

Consider that $AB = 0$, the columns of B are in the null space of A, and the vectors in \mathbb{R}^n .

The objective is to prove that $\text{rank}(B) + \text{rank}(A) \leq n$.

Step-2

We know that the dimension of column space of the matrix is the rank of that particular matrix.

Given the columns of B are in the null space of A.

$$\text{i.e. } \dim(C(B)) \leq \dim(N(A)) \quad \text{--- (1)}$$

Therefore, $\dim(N(A))$ is rank of the matrix B.

$$\text{i.e. } \text{rank}(B) \leq \dim(N(A)) \quad \text{--- (2)}$$

Step-3

Again, we know that,

dimension of $C(A)$ + dimension of $N(A)$ = number of columns.

$$\dim C(A) + \dim N(A) = n \quad (\because n \text{ is number of columns}) \quad \text{--- (3)}$$

From the equations (1), (2) and (3),

$$\dim C(A) + \dim N(A) = n$$

$$\text{rank}(A) + \dim N(A) = n$$

$$\text{rank}(A) + \text{rank}(B) \leq n$$

Therefore, it is proved that $\boxed{\text{rank}(B) + \text{rank}(A) \leq n}$.
