

Step-1

(b)

Consider the line passing through $(1,1,1)$ and the plane through $(1,0,0)$ and $(0,1,1)$. Both these subspaces pass through the origin and therefore,

$\{0\}$ is clearly in their intersection.

Further note that the vectors $(1,0,0)$ and $(0,1,1)$ belong to the plane, therefore, their addition also belongs to the plane.

But $(1,0,0) + (0,1,1) = (1,1,1)$, which is along the straight line, passing through $(1,1,1)$.

Therefore, the line is contained in the plane.

Thus, the intersection of the plane and the line is the line itself.

Step-2

Since the line is contained in the plane itself, adding a vector to any of the vector in the plane will produce a vector in the plane only.

Thus, sum of the two subspaces is the plane itself, which passes through $(1,0,0)$ and $(0,1,1)$.

Step-3

(c)

Consider the two subspaces $\{0\}$ and \mathbf{R}^3 of the vector space \mathbf{R}^3 .

It is clear that their intersection is the subspace $\{0\}$ and their addition is the entire \mathbf{R}^3 .

Step-4

(d)

Consider two subspaces of \mathbf{R}^3 , one is a plane perpendicular to the vector $(1,1,0)$ and the plane, perpendicular to $(0,1,1)$.

Since both the planes are subspaces, these must pass through the origin $(0,0,0)$.

The equation of the plane, perpendicular to $(1,1,0)$ is $x - y = 0$.

That is $x = y$. The equation of the plane, perpendicular to $(0,1,1)$ is $y - z = 0$.

That is $y = z$.

Their intersection is the straight line, which passes through the origin and passes through all those points, for which $x = z$. It is clear that the sum of these two subspaces is the complete vector space \mathbf{R}^3 .
