

## Step-1

Suppose that  $A$  and  $B$  are square matrices of order  $n$ ; and  $AB = I$ .

The objective is to prove that the rank of  $A$  is  $n$ , if  $\text{rank}(AB) \leq \text{rank}(A)$ .

## Step-2

Since,  $A$ , and  $B$  are square matrices of order  $n$ .

So,

$$\text{rank}(A) \leq n \quad \text{--- (1)}$$

Since,  $I$  identity matrix of order  $n$ , then

$$\begin{aligned} n &= \text{rank}(I_n) \\ &= \text{rank}(AB) \\ &\leq \min\{\text{rank}(A), \text{rank}(B)\} \\ &= \text{rank}(A) \end{aligned}$$

Therefore,

$$n \leq \text{rank}(A) \quad \text{--- (2)}$$

From equations, (1), and (2),  $\boxed{\text{rank}(A) = n}$ .
