

Step-1

a) We have to describe a subspace of \mathbf{M} that contains $A = \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$ but not $B = \begin{bmatrix} 0 & 0 \\ 0 & -1 \end{bmatrix}$

Let \mathbf{M} be the subspace that contains $A = \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$ but not $B = \begin{bmatrix} 0 & 0 \\ 0 & -1 \end{bmatrix}$

$$\text{Let } M = \left\{ \begin{bmatrix} a & 0 \\ 0 & 0 \end{bmatrix} \mid a \in \mathbf{R} \right\}$$

Clearly \mathbf{M} is a vector space where vector addition is matrix addition, whose scalar multiplication is a constant multiple of a 2 by 2 matrix.

$$\begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} \in \mathbf{M} \quad \text{And also } \begin{bmatrix} 0 & 0 \\ 0 & -1 \end{bmatrix} \notin \mathbf{M}$$

i.e., the \mathbf{M} is the smallest subspace containing $\begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$

Step-2

b) Yes, it \mathbf{M} contains I .

Since the linear combination

$$1 \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} + (-1) \begin{bmatrix} 0 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I$$

Therefore if a subspace \mathbf{M} contains A and B , must b contain I .

Step-3

c) Consider the subspace of all matrices where main diagonal is all zero

$$\text{Let } M = \left\{ \begin{bmatrix} 0 & a \\ b & 0 \end{bmatrix} \mid a, b \in \mathbf{R} \right\}$$

Then M is a subspace of the vector space of 2×2 matrices.
