

Step-1

In Hilbert space, to find the length of the vector $v = \left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{4}}, \frac{1}{\sqrt{8}}, \dots \right)$ and the length of the function $f(x) = e^x$ (over the interval $0 \leq x \leq 1$), and

Also to find the inner product of;

$$f(x) = e^x$$

$$g(x) = e^{-x}$$

Over this interval

Step-2

In Hilbert space, if $v = (v_1, v_2, v_3, \dots)$ then

$$\|v\|^2 = v_1^2 + v_2^2 + v_3^2 + \dots$$

Given, $v = \left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{4}}, \frac{1}{\sqrt{8}}, \dots \right)$

$$\|v\|^2 = \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots$$

$$= \frac{a}{1-r} \text{ (Sum of infinite G.P)}$$

$$= \frac{1/2}{1 - \frac{1}{2}}$$

$$= \frac{1/2}{1/2}$$

$$= 1$$

Length of the vector $v = \|v\|$

$$= \sqrt{1}$$

$$= \boxed{1}$$

Step-3

Now,

$$\begin{aligned}
\|f\|^2 &= \int_0^1 [f(x)]^2 dx \\
&= \int_0^1 (e^x)^2 dx \\
&= \int_0^1 e^{2x} dx \\
&= \left[\frac{e^{2x}}{2} \right]_0^1 \\
&= \frac{e^2}{2} - \frac{e^0}{2} \\
&= \frac{e^2 - 1}{2}
\end{aligned}$$

Step-4

Therefore the length of the function $f(x)$;

$$\begin{aligned}
&= \|f(x)\| \\
&= \sqrt{\frac{e^2 - 1}{2}}
\end{aligned}$$

Step-5

Let

$$\begin{aligned}
f(x) &= e^x, \\
g(x) &= e^{-x}
\end{aligned}$$

Inner product of f and g ;

$$\begin{aligned}
&= (f, g) \\
&= \int_0^1 e^x e^{-x} dx \\
&= \int_0^1 e^0 dx
\end{aligned}$$

$$\begin{aligned}
&= \int_0^1 1 dx \\
&= [x]_0^1 \\
&= 1 - 0 \\
&= 1
\end{aligned}$$

Hence inner product of f and g is 1
