

Step-1

Permutation matrix: Matrix P has single 1 in every row and every column. It has the rows of identity matrix I in any order.

Step-2

Consider P has 1s on the anti-diagonal from $(1,n)$ to $(n,1)$ and let A be any matrix then describe PAP .

Matrix P with 1s on the anti-diagonal from $(1,n)$ to $(n,1)$ will be:

$$P = \begin{bmatrix} 0 & 0 & 0 & \dots & 1 \\ 0 & 0 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \dots & \vdots \\ 0 & 1 & 0 & \dots & 0 \\ 1 & 0 & 0 & \dots & 0 \end{bmatrix}$$

Here, $P = P^T$. Recall that $P^T = P^{-1}$, so $P = P^{-1}$.

Step-3

Let A be any matrix. Multiplication with matrix P , (PA) destroys the symmetry of matrix A . To recover the symmetry it is multiplied by a permutation matrix Q (PAQ) . This matrix Q is none other than P^T . So, PAP^T guarantees to be symmetric.

Therefore, PAP becomes a symmetric matrix.
