

Step-1

Given that $A = \begin{bmatrix} 1 & -1 \\ 2 & 4 \end{bmatrix}$

To find the Eigen values and Eigen vectors of $B = A - 7I$ and their relation with those of A

Step-2

Given;

$$B = A - 7I \\ = \begin{bmatrix} -6 & -1 \\ 2 & -3 \end{bmatrix}$$

The number λ is Eigen value of B if and only if $|B - \lambda I| = 0$

This implies;

$$\begin{vmatrix} -6 - \lambda & -1 \\ 2 & -3 - \lambda \end{vmatrix} = 0$$

This implies;

$$\begin{aligned} (-6 - \lambda)(-3 - \lambda) - (-1)(2) &= 0 \\ \lambda^2 + 9\lambda + 20 &= 0 \\ (\lambda + 4)(\lambda + 5) &= 0 \end{aligned}$$

Thus;

$$\lambda = -4 \text{ and } \lambda = -5$$

Step-3

If $\lambda = -4$ and $(B - \lambda I)x_1 = 0$

This implies;

$$\begin{bmatrix} -2 & -1 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \\ 2y + z = 0 \\ \frac{y}{-1} = \frac{z}{2}$$

The eigen vector is any non-zero multiple of x_1

Eigen vector for $\lambda_1 = -4$ is $\begin{bmatrix} -1 \\ 2 \end{bmatrix}$.

Step-4

If $\lambda_2 = -5$ and $(B - \lambda_2 I)x_2 = 0$

This implies;

$$\begin{bmatrix} -1 & -1 \\ 2 & 2 \end{bmatrix} \begin{bmatrix} y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$y + z = 0$$
$$\frac{y}{-1} = \frac{z}{1}$$

The Eigen vector is any non zero multiple of x_2 .

Eigen vector for $\lambda_2 = -5$ is $\begin{bmatrix} -1 \\ 1 \end{bmatrix}$.

Step-5

Step-6

Now, calculate Eigen values of $A = \begin{bmatrix} 1 & -1 \\ 2 & 4 \end{bmatrix}$

The number λ is Eigen value of A if and only if $|A - \lambda I| = 0$

This implies;

$$\begin{vmatrix} 1-\lambda & -1 \\ 2 & 4-\lambda \end{vmatrix} = 0$$

This implies;

$$(1-\lambda)(4-\lambda) - (-1)(2) = 0$$
$$\lambda^2 - 5\lambda + 6 = 0$$
$$(\lambda - 2)(\lambda - 3) = 0$$

Thus,

$$\lambda = 2 \text{ and}$$

$$\lambda = 3$$

Step-7

$$\text{If } \lambda = 2 \text{ and } (A - \lambda I)x_1 = 0$$

This implies;

$$\begin{bmatrix} -1 & -1 \\ 2 & 2 \end{bmatrix} \begin{bmatrix} y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$2y + 2z = 0$$
$$\frac{y}{-1} = \frac{z}{1}$$

The Eigen vector is any non-zero multiple of x_1

$$\text{Eigen vector for } \lambda_1 = 2 \text{ is } \begin{bmatrix} -1 \\ 1 \end{bmatrix}.$$

Step-8

$$\text{If } \lambda = 3 \text{ and } (A - \lambda I)x_1 = 0$$

This implies;

Step-9

$$\begin{bmatrix} -2 & -1 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$2y + z = 0$$
$$\frac{y}{-1} = \frac{z}{2}$$

The Eigen vector is any non-zero multiple of x_1

$$\text{Eigen vector for } \lambda_1 = 3 \text{ is } \begin{bmatrix} -1 \\ 2 \end{bmatrix}.$$

Step-10

From the above Eigen values of A and B , it is clear that both the Eigen values are reduced by 7 to that of A and there is no change in their corresponding Eigen vectors.
