

Step-1

Let $A^{-1}b = x$ and further suppose that x satisfies $Cx = d$.

Thus, we get

$$\begin{aligned}P_{C/\min} &= P_{\min} + \frac{1}{2}y^T(CA^{-1}b - d) \\&= P_{\min} + \frac{1}{2}y^T(Cx - d) \\&= P_{\min} + \frac{1}{2}y^T(0) \\&= P_{\min}\end{aligned}$$

Step-2

Thus, whenever $A^{-1}b = x$ satisfies $Cx = d$, we get $\boxed{P_{C/\min} = P_{\min}}$.
