Step-1

Given system is 2x + 3y = 1

10x + 9y = 11

Given system can be written matrix form as

 $\begin{pmatrix} 2 & 3 \\ 10 & 9 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} 1 \\ 11 \end{pmatrix}$

The augmented matrix is

 $\begin{pmatrix} 2 & 3 & 1 \\ 10 & 9 & 11 \end{pmatrix}$

Step-2

Subtract $\frac{10}{2} = 5$ times the first row from the second row to get $\begin{pmatrix} \boxed{2} & 3 & 1 \\ 0 & \boxed{-6} & 6 \end{pmatrix}$ which is an upper triangular system

2x + 3y = 1

-6y = 6

By back-substitution -6y = 6

 $\Rightarrow y = -1$

And 2x+3(-1)=1

 $\Rightarrow x = 2$

Hence the solution is (2,-1)

Step-3

Verification:-

Put x = 2, y = -1 in the given system

2x + 3y = 2(2) + 3(-1)

= 1

$$10x + 9y = 10(2) + 9(-1)$$
$$= 11$$

Hence $x \text{ times}^{(2,10)}$ plus $y \text{ times}^{(3,9)}$ equals (1,11).

Step-4

If right-hand side changes to (4,44), then the augmented matrix is

$$\begin{pmatrix}2&3&4\\10&9&44\end{pmatrix}$$

Subtract â€~5' times the first row from the second row

$$\begin{pmatrix}
\boxed{2} & 3 & 4 \\
0 & \boxed{-6} & 24
\end{pmatrix}$$

which is upper triangular system 2x + 3y = 4

$$-6y = 24$$

By back-substitution, we have -6y = 24

$$\Rightarrow y = -4$$

And
$$2x+3(-4)=4$$

$$\Rightarrow x = 8$$

Hence the solution is (8,-4)
