Step-1

Given that the only solution to Ax = 0 (m equations in n unknowns) is x = 0. We have to find the rank of A and we have to verify that whether the columns of A are linearly independent or not.

Step-2

Given that the only solution of Ax = 0 is x = 0

So the null space of $A = \{0\}$

Therefore $\dim \mathbf{N}(\mathbf{A}) = 0$

From a known theorem,

 $\dim(\mathbf{N}(A)) + \dim(\mathbf{C}(A)) = \text{Number of columns of } A$

Step-3

 $\Rightarrow \dim(\mathbf{C}(A)) = \text{Number of columns of } A \text{ (since dim } \mathbf{N}(A) = 0)$

Since A is m by n matrix, numbers of columns of A is n

Therefore $\dim(\mathbf{C}(A)) = n$

Hence the rank of A = n, and hence the columns of A are linearly independent.
